(57) **ABSTRACT**

A method of moving freight which utilizes removable storage units or containers that have the same or similar size and which can be positioned on a specially designed truck frame and/or a trailer frame. The storage units are filled with freight such as household goods, taken to a storage facility or warehouse and stored by removing the entire storage unit from the truck or trailer utilizing, for example, a fork lift. The freight can be reloaded by loading the storage unit onto a truck or a trailer, which then delivers the freight to its final destination where it is removed from the storage unit. Multiple storage units loaded at different locations can be transported by the same truck and trailer from the warehouse to separate final unloading destinations. The truck and trailer are connected by a stinger steer mechanism which adjusts the distance between the truck and trailer providing a more versatile unit.
